Description

Parts and characteristics

- Mechanical stops for setting the damper blade positions
- Electric or pneumatic operation
- Overload protection
- Control input signal: 1-wire control, 2-wire control (3-point) or pneumatic control

- Optional spring return actuator for damper blade safety function
- Optional auxiliary switch for capturing the end positions

Functional description

The actuator opens or closes the damper blade. Minimum and maximum positions can be set using mechanical stops.

1-wire control or 2-wire control (3-point) can be used.

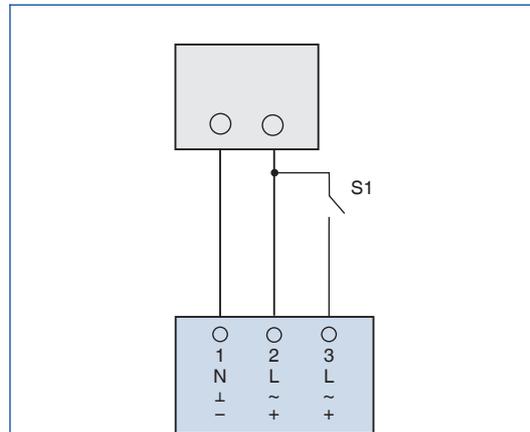

1-wire control is actually an open/close control.

A spring return actuator moves the damper blade to the safe position in case of a power failure.

Define the safe position with the order code: NC (normally closed) or NO (normally open). The spring return actuator is factory set according to the safe position.

The normal position of the damper blade is only achieved with 1-wire control (control voltage).
